ZIRCONIA EXTRUDATES

ABSTRACT

A process for preparing a calcined zirconia extrudate comprising the steps of:

- a. preparing a shapable dough which comprises mixing and kneading a particulate zirconia with a solvent to obtain a mixture having a total solids content of from about 50% to about 85% by weight,
- extruding the shapable dough to form a zirconia extrudate, and
- c. drying and calcining the zirconia extrudate; characterized in that the particulate zirconia comprises no more than about 15% by weight of zirconia which is other than monoclinic zirconia.

The calcined zirconium extrudates prepared according to the present invention exhibit significantly improved crush strength and is suitable as a catalyst or catalyst support in a wide range of chemical processes.
